# CS425 - Summer 2016 Jason Arnold Chapter 3: Formal Relational Query Languages 

Modified from:
Database System Concepts, $6^{\text {th }}$ Ed.

# Chapter 3: Formal Relational Query Languages 

n Relational Algebra

## Textbook: Chapter 6

## TA: Xin Su

## n Xin Su

n Email: xsu11@hawk.iit.edu
n Phone: 312-479-2925

## Relational Algebra

n Procedural language
n Six basic operators
। select: $\sigma$
। project: $\Pi$
। union: $\cup$
। set difference: -
| Cartesian product: $x$
| rename: $\rho$
$n$ The operators take one or two relations as inputs and produce a new relation as a result.
composable

## Select Operation - Example

n Relation r

| $A$ | $B$ | $C$ | $D$ |
| :--- | :--- | :--- | :--- |
| $\alpha$ | $\alpha$ | 1 | 7 |
| $\alpha$ | $\beta$ | 5 | 7 |
| $\beta$ | $\beta$ | 12 | 3 |
| $\beta$ | $\beta$ | 23 | 10 |

- $\sigma_{A=B \wedge} D^{\prime}(r)$

| $A$ | $B$ | $C$ | $D$ |
| :--- | :--- | :--- | :--- |
| $\alpha$ | $\alpha$ | 1 | 7 |
| $\beta$ | $\beta$ | 23 | 10 |

## Select Operation

n Notation: $\sigma_{p}(r)$
$n \quad p$ is called the selection predicate
$n$ Defined as:

$$
\sigma_{p}(r)=\{t \mid t \in r \wedge p(t)\}
$$

Where $p$ is a formula in propositional calculus consisting of terms connected by : ^(and), $\vee$ (or), $\neg$ (not)
Each term is one of:
<attribute> op <attribute> or <constant>
where op is one of: $=, \neq,>, \geq .<. \leq$
n Example of selection:

$$
\sigma_{\text {dept_name= "Physics }} \text { (instructor) }
$$

## Project Operation - Example

$n$ Relation $r$ :

| $A$ | $B$ | $C$ |
| :--- | :--- | :--- |
| $\alpha$ | 10 | 1 |
| $\alpha$ | 20 | 1 |
| $\beta$ | 30 | 1 |
| $\beta$ | 40 | 2 |

n $\prod_{\mathrm{A}, \mathrm{C}}(r) \quad$\begin{tabular}{|l|l|}
\hline$A$ \& $C$ <br>
\hline \hline$\alpha$ \& 1 <br>
$\alpha$ \& 1 <br>
$\beta$ \& 1 <br>
$\beta$ \& 2 <br>
\hline

$=$

\hline$A$ \& $C$ <br>
\hline \hline$\alpha$ \& 1 <br>
$\beta$ \& 1 <br>
$\beta$ \& 2 <br>
\hline
\end{tabular}

## Project Operation

n Notation:

$$
\Pi_{A_{1}, A_{2}, \ldots, A_{k}}(r)
$$

where $A_{1}, A_{2}$ are attribute names and $r$ is a relation name.
$n \quad$ The result is defined as the relation of $k$ columns obtained by erasing the columns that are not listed
n Duplicate rows removed from result, since relations are sets
$n \quad$ Let $A$ be a subset of the attributes of relation $r$ then:

$$
\pi_{A}(r)=\{t . A \mid t \in r\}
$$

n Example: To eliminate the dept_name attribute of instructor

$$
\Pi_{I D, \text { name, salary }} \text { (instructor) }
$$

## Union Operation - Example

$n$ Relations $r$, $s$ :

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
| $r$ |  |

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 2 |
| $\beta$ | 3 |
| $s$ |  |

n $\mathrm{r} \cup \mathrm{s}:$

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
| $\beta$ | 3 |

## Union Operation

n Notation: $r \cup s$
$n$ Defined as:

$$
r \cup s=\{t \mid t \in r \vee t \in s\}
$$

$n \quad$ For $r \cup s$ to be valid.

1. $r, s$ must have the same arity (same number of attributes)
2. The attribute domains must be compatible (example: $2^{\text {nd }}$ column of $r$ deals with the same type of values as does the $2^{\text {nd }}$ column of $s$ )
n Example: to find all courses taught in the Fall 2009 semester, or in the Spring 2010 semester, or in both

$$
\begin{aligned}
& \Pi_{\text {course_id }}\left(\sigma_{\text {semester }=" F a l l " ~}^{\text {^ year=2009 }}(\text { section })\right) \cup \\
& \Pi_{\text {course_id }}\left(\sigma_{\text {semester }} \text { "Spring" } \wedge \text { year=2010 }(\text { section })\right)
\end{aligned}
$$

## Set difference of two relations

$n$ Relations $r$, $s$ :

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
|  |  |$\quad$| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 2 |
| $\beta$ | 3 |

n $r-s$ :

| $A$ | $B$ |
| :--- | :--- |
| $\alpha$ | 1 |
| $\beta$ | 1 |

## Set Difference Operation

n Notation $r-s$
$n$ Defined as:

$$
r-s=\{t \mid t \in r \wedge t \notin s\}
$$

n Set differences must be taken between compatible relations.
। $r$ and $s$ must have the same arity
। attribute domains of $r$ and $s$ must be compatible
n Example: to find all courses taught in the Fall 2009 semester, but not in the Spring 2010 semester

$$
\begin{aligned}
& \Pi_{\text {course_id }}\left(\sigma_{\text {semester= "Fall" } " \wedge \text { year=2009 }}(\text { section })\right)- \\
& \prod_{\text {course_id }}\left(\sigma_{\text {semester }}=\text { "Spring" } \wedge \text { year=2010 }(\text { section })\right)
\end{aligned}
$$

## Cartesian-Product Operation - Example

$n$ Relations $r$, $s$ :

| $A$ | $B$ |
| :---: | :---: |
| $\alpha$ | 1 |
| $\beta$ | 2 |
|  |  |

| $C$ | $D$ | $E$ |
| :--- | :--- | :--- |
| $\alpha$ | 10 | a |
| $\beta$ | 10 | a |
| $\beta$ | 20 | b |
| $\gamma$ | 10 | b |

$s$
n rxs:

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :---: | :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 20 | b |
| $\alpha$ | 1 | $\gamma$ | 10 | b |
| $\beta$ | 2 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |
| $\beta$ | 2 | $\gamma$ | 10 | b |

## Cartesian-Product Operation

n Notation $r \times s$
$n$ Defined as:

$$
r \times s=\left\{t, t^{\prime} \mid t \in r \wedge t^{\prime} \in s\right\}
$$

$n$ Assume that attributes of $r(R)$ and $s(S)$ are disjoint. (That is, $R \cap S=\varnothing$ ).
$n$ If attributes of $r(R)$ and $s(S)$ are not disjoint, then renaming must be used.

## Composition of Operations

n Can build expressions using multiple operations
$n$ Example: $\sigma_{A=C}(r x s)$
n $r x s$

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :---: | :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 10 | a |
| $\alpha$ | 1 | $\beta$ | 20 | b |
| $\alpha$ | 1 | $\gamma$ | 10 | b |
| $\beta$ | 2 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |
| $\beta$ | 2 | $\gamma$ | 10 | b |

n $\quad \sigma_{A=C}(r x s)$

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :--- | :--- | :--- | :--- | :--- |
| $\alpha$ | 1 | $\alpha$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 10 | a |
| $\beta$ | 2 | $\beta$ | 20 | b |

## Rename Operation

n Allows us to name, and therefore to refer to, the results of relationalalgebra expressions.
n Allows us to refer to a relation by more than one name.
n Example:

$$
\rho_{x}(r)
$$

returns the expression $E$ under the name $X$
$n$ If a relational-algebra expression $E$ has arity $n$, then

$$
\boldsymbol{P}_{x\left(A_{1}, A_{2}, \ldots, A_{n}\right)}(r)
$$

returns the result of expression $E$ under the name $X$, and with the attributes renamed to $A_{1}, A_{2}, \ldots, A_{n}$.

$$
\begin{aligned}
\rho_{X}(r) & =\{t(X) \mid t \in r\} \\
\rho_{X(A)}(r) & =\{t(X) \cdot A \mid t \in r\}
\end{aligned}
$$

## Example Query

$n$ Find the largest salary in the university
। Step 1: find instructor salaries that are less than some other instructor salary (i.e. not maximum)

- using a copy of instructor under a new name $d$
$\pi_{\text {instructor.salary }}\left(\sigma_{\text {instructor.salary }}<\right.$ d.salary

$$
\left.\left(\text { instructor } \times \rho_{d}(\text { instructor })\right)\right)
$$

Step 2: Find the largest salary

$$
\begin{aligned}
& \pi_{\text {salary }}(\text { instructor })- \\
& \pi_{\text {instructor.salary }}\left(\sigma_{\text {instructor.salary }<\text { d.salary }}\right. \\
& \left.\quad\left(\text { instructor } \times \rho_{d}(\text { instructor })\right)\right)
\end{aligned}
$$

## Example Queries

$n$ Find the names of all instructors in the Physics department, along with the course_id of all courses they have taught

## Query 1

$\pi_{\text {instructor.I }} D$, course_id $\left(\sigma_{\text {dept_name }}=^{\prime}\right.$ Physics $^{\prime}($ $\sigma_{\text {instructor. } I D=\text { teaches. } I D}($ instructor $\times$ teaches $\left.\left.)\right)\right)$

## Query 2

$\pi_{\text {instructor. } I D, \text { course_id }}\left(\sigma_{\text {instructor.I }} D=\right.$ teaches.I $D($ $\sigma_{\text {dept_name }={ }^{\prime} \text { Physics }}($ instructor $\times$ teaches $\left.\left.)\right)\right)$

## Formal Definition (Syntax)

n A basic expression in the relational algebra consists of either one of the following:

। A relation in the database
। A constant relation: e.g., $\{(1),(2)\}$
n Let $E_{1}$ and $E_{2}$ be relational-algebra expressions; the following are all relational-algebra expressions:

। $E_{1} \cup E_{2}$
| $E_{1}-E_{2}$
| $E_{1} \times E_{2}$
। $\sigma_{p}\left(E_{1}\right), P$ is a predicate on attributes in $E_{1}$
। $\Pi_{S}\left(E_{1}\right), S$ is a list consisting of some of the attributes in $E_{1}$
। $\rho_{x}\left(E_{1}\right), \mathrm{x}$ is the new name for the result of $E_{1}$

## Null Values

n It is possible for tuples to have a null value, denoted by null, for some of their attributes
n null signifies an unknown value or that a value does not exist.
$n \quad$ The result of any arithmetic expression involving null is null.
$n$ Aggregate functions simply ignore null values (as in SQL)
$n$ For duplicate elimination and grouping, null is treated like any other value, and two nulls are assumed to be the same (as in SQL)

## Null Values

n Comparisons with null values return the special truth value: unknown
। If false was used instead of unknown, then not $(A<5)$ would not be equivalent to $\quad A>=5$
n Three-valued logic using the truth value unknown:
। OR: (unknown or true) = true, (unknown or false) = unknown
(unknown or unknown) = unknown
। AND: (true and unknown) = unknown, (false and unknown) = false, (unknown and unknown) = unknown
। NOT: (not unknown) = unknown
I In SQL " $P$ is unknown" evaluates to true if predicate $P$ evaluates to unknown
n Result of select predicate is treated as false if it evaluates to unknown

## Additional Operations

We define additional operations that do not add any expressive power to the relational algebra, but that simplify common queries.
n Set intersection
n Natural join
n Assignment
n Outer join

## Set-Intersection Operation

n Notation: $r \cap s$
$n$ Defined as:

$$
r \cap s=\{t \mid t \in r \wedge t \in s\}
$$

n Assume:
I $r, s$ have the same arity
। attributes of $r$ and $s$ are compatible
$n$ Note: $r \cap s=r-(r-s)$
। That is adding intersection to the language does not make it more expressive

## Set-Intersection Operation - Example

$n$ Relation $r$, $s$ :

| $A$ | $B$ |
| :--- | :--- |
| $\alpha$ | 1 |
| $\alpha$ | 2 |
| $\beta$ | 1 |
| $r$ |  |$\quad$| $A$ | $B$ |
| :--- | :--- | :--- |
| $\alpha$ | 2 |
| $\beta$ | 3 |

n $\quad r \cap S$

| $A$ | $B$ |
| :--- | :--- |
| $\alpha$ | 2 |

## Natural-Join Operation

n Notation: $\mathrm{r} \bowtie$ s
$n \quad$ Let $r$ and $s$ be relations on schemas $R$ and $S$ respectively.
Then, $\mathrm{r} \bowtie \mathrm{s}$ is a relation on schema $R \cup S$ obtained as follows:
। Consider each pair of tuples $t_{r}$ from $r$ and $t_{s}$ from $s$.
I If $t_{r}$ and $t_{s}$ have the same value on each of the attributes in $R \cap S$, add a tuple $t$ to the result, where
, $t$ has the same value as $t_{r}$ on $r$

- $t$ has the same value as $t_{s}$ on $s$
n Example:

$$
\begin{aligned}
& R=(A, B, C, D) \\
& S=(E, B, D)
\end{aligned}
$$

। Result schema $=(A, B, C, D, E)$
। $r \bowtie s$ is defined as:

$$
\Pi_{r . A, r . B, r . C, r . D, s . E}\left(\sigma_{r . B}=s . B \wedge r . D=s . D(r \times s)\right)
$$

## Natural-Join Operation (cont.)

$n \quad$ Let $r$ and $s$ be relations on schemas $R$ and $S$ respectively. Then, $r \bowtie s$ is defined as:

$$
\begin{aligned}
X & =R \cap S \\
S^{\prime} & =S-R \\
r \bowtie s & =\pi_{R, S^{\prime}}\left(\sigma_{r . X=s . X}(r \times s)\right)
\end{aligned}
$$

## Natural Join Example

n Relations $\mathrm{r}, \mathrm{s}$ :

| $A$ | $B$ | $C$ | $D$ |
| :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | a |
| $\beta$ | 2 | $\gamma$ | a |
| $\gamma$ | 4 | $\beta$ | b |
| $\alpha$ | 1 | $\gamma$ | a |
| $\delta$ | 2 | $\beta$ | b |
| $\gamma$ |  |  |  |

| $B$ | $D$ | $E$ |
| :---: | :---: | :---: |
| 1 | a | $\alpha$ |
| 3 | a | $\beta$ |
| 1 | a | $\gamma$ |
| 2 | b | $\delta$ |
| 3 | b | $\varepsilon$ |
| $s$ |  |  |

$n \quad r \bowtie s$

| $A$ | $B$ | $C$ | $D$ | $E$ |
| :---: | :---: | :---: | :---: | :---: |
| $\alpha$ | 1 | $\alpha$ | a | $\alpha$ |
| $\alpha$ | 1 | $\alpha$ | a | $\gamma$ |
| $\alpha$ | 1 | $\gamma$ | a | $\alpha$ |
| $\alpha$ | 1 | $\gamma$ | a | $\gamma$ |
| $\delta$ | 2 | $\beta$ | b | $\delta$ |

## Assignment Operation

$\mathrm{n} \quad$ The assignment operation $(\leftarrow)$ provides a convenient way to express complex queries.
। Write query as a sequential program consisting of

- a series of assignments
- followed by an expression whose value is displayed as a result of the query.
Assignment must always be made to a temporary relation variable.

$$
\begin{aligned}
& E_{1} \leftarrow \sigma_{\text {salary }>40000}(\text { instructor }) \\
& E_{2} \leftarrow \sigma_{\text {salary }<10000}(\text { instructor }) \\
& E_{3} \leftarrow E_{1} \cup E_{2}
\end{aligned}
$$

## Outer Join

$n$ An extension of the join operation that avoids loss of information.
n Computes the join and then adds tuples form one relation that does not match tuples in the other relation to the result of the join.
n Uses null values:
| null signifies that the value is unknown or does not exist
। All comparisons involving null are (roughly speaking) false by definition.

- We shall study precise meaning of comparisons with nulls later

## Outer Join - Example

n Relation instructor1

| ID | name | dept_name |
| :--- | :--- | :---: |
| 10101 | Srinivasan | Comp. Sci. |
| 12121 | Wu | Finance |
| 15151 | Mozart | Music |

n Relation teaches1

| ID | course_id |
| :--- | :--- |
| 10101 | CS-101 |
| 12121 | FIN-201 |
| 76766 | BIO-101 |

## Outer Join - Example

n Join
instructor $\bowtie$ teaches

| $I D$ | name | dept_name | course_id |
| ---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |

n Left Outer Join instructor $\square$ teaches

| $I D$ | name | dept_name | course_id |
| :---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 15151 | Mozart | Music | null |

## Outer Join - Example

n Right Outer Join
instructor $\bowtie^{-}$teaches

| ID | name | dept_name | course_id |
| :---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 76766 | null | null | BIO-101 |

n Full Outer Join
instructor_\×_ teaches

| ID | name | dept_name | course_id |
| ---: | :--- | :---: | :--- |
| 10101 | Srinivasan | Comp. Sci. | CS-101 |
| 12121 | Wu | Finance | FIN-201 |
| 15151 | Mozart | Music | null |
| 76766 | null | null | BIO-101 |

## Outer Join using Joins

n Outer join can be expressed using basic operations

$$
\begin{aligned}
r \_\bowtie s & =(r \bowtie s) \cup\left(\left(r-\Pi_{R}(r \bowtie s)\right) \times\{(n u l l, \ldots, n u l l)\}\right) \\
r \bowtie s & =(r \bowtie s) \cup\left(\{(n u l l, \ldots, n u l l)\} \times\left(s-\Pi_{S}(r \bowtie s)\right)\right) \\
r \unrhd_{-} s & =(r \bowtie s) \cup\left(\left(r-\Pi_{R}(r \bowtie s)\right) \times\{(n u l l, \ldots, n u l l)\}\right) \\
& \cup\left(\{(n u l l, \ldots, n u l l)\} \times\left(s-\Pi_{S}(r \bowtie s)\right)\right)
\end{aligned}
$$

## Extended Relational-Algebra-Operations

n Generalized Projection
n Aggregate Functions

## Generalized Projection

n Extends the projection operation by allowing arithmetic functions to be used in the projection list.

$$
\pi_{F_{1}, \ldots, F_{n}}(E)
$$

$n \quad E$ is any relational-algebra expression
n Each of $F_{1}, F_{2}, \ldots, F_{n}$ are arithmetic expressions and function calls involving constants and attributes in the schema of $E$.
n Given relation instructor(ID, name, dept_name, salary) where salary is annual salary, get the same information but with monthly salary

$$
\Pi_{I D, \text { name, dept_name, salary/12 }} \text { (instructor) }
$$

n Adding functions increases expressive power!
। In standard relational algebra there is no way to change attribute values

## Aggregate Functions and Operations

n Aggregation function takes a set of values and returns a single value as a result.

avg: average value<br>min: minimum value<br>max: maximum value<br>sum: sum of values<br>count: number of values

n Aggregate operation in relational algebra

$$
G_{1}, G_{2}, \ldots, G_{n} G_{F_{1}}\left(A_{1}\right), F_{2}\left(A_{2}\right), \ldots, F_{n}\left(A_{n}\right)(E)
$$

$E$ is any relational-algebra expression
। $G_{1}, G_{2} \ldots, G_{n}$ is a list of attributes on which to group (can be empty)
। Each $F_{i}$ is an aggregate function
। Each $A_{i}$ is an attribute name
n Note: Some books/articles use $\gamma$ instead of $\mathcal{G}$ (Calligraphic G)

## Aggregate Operation - Example

n Relation $r$.

| $A$ | $B$ | $C$ |
| :---: | :---: | :---: |
| $\alpha$ | $\alpha$ | 7 |
| $\alpha$ | $\beta$ | 7 |
| $\beta$ | $\beta$ | 3 |
| $\beta$ | $\beta$ | 10 |

$\mathrm{n} \mathcal{G}_{\operatorname{sum}(\mathrm{c})}(\mathrm{r})$
sum( $c$ )

## Aggregate Operation - Example

n Find the average salary in each department
dept_name $\mathcal{G}$ avg(salary) (instructor)

| ID | name | dept_name | salary |
| :---: | :--- | :--- | :--- |
| 76766 | Crick | Biology | 72000 |
| 45565 | Katz | Comp. Sci. | 75000 |
| 10101 | Srinivasan | Comp. Sci. | 65000 |
| 83821 | Brandt | Comp. Sci. | 92000 |
| 98345 | Kim | Elec. Eng. | 80000 |
| 12121 | Wu | Finance | 90000 |
| 76543 | Singh | Finance | 80000 |
| 32343 | El Said | History | 60000 |
| 58583 | Califieri | History | 62000 |
| 15151 | Mozart | Music | 40000 |
| 33456 | Gold | Physics | 87000 |
| 22222 | Einstein | Physics | 95000 |

| dept_name | avg_salary |
| :--- | :--- |
| Biology | 72000 |
| Comp. Sci. | 77333 |
| Elec. Eng. | 80000 |
| Finance | 85000 |
| History | 61000 |
| Music | 40000 |
| Physics | 91000 |

## Aggregate Functions (Cont.)

n What are the names for attributes in aggregation results?
। Need some convention!

- E.g., use the expression as a name avg(salary)

। For convenience, we permit renaming as part of aggregate operation
dept_name Gavg(salary) as avg_sal (instructor)

## Modification of the Database

n The content of the database may be modified using the following operations:

I Deletion
| Insertion
। Updating
$n \quad$ All these operations can be expressed using the assignment operator
n Example: Delete instructors with salary over \$1,000,000

$$
R \leftarrow R-\left(\sigma_{\text {salary }>1000000}(R)\right)
$$

## Restrictions for Modification

n Consider a modification where $R=(A, B)$ and $S=(C)$

$$
R \leftarrow \sigma_{C>5}(S)
$$

$n$ This would change the schema of R!
। Should not be allowed
n Requirements for modifications
| The name $\mathbf{R}$ on the left-hand side of the assignment operator refers to an existing relation in the database schema

। The expression on the right-hand side of the assignment operator should be union-compatible with $\mathbf{R}$

## End of Chapter 3
