ILLINOIS INSTITUTE OF TECHNOLOGY

0) Course Info
1) Introduction
2) Data Preparation and Cleaning
3) Schema matching and mapping
4) Virtual Data Integration
5) Data Exchange
6) Data Warehousing
7) Big Data Analytics
8) Data Provenance

1

Overview

ILLINOIS INSTITUTE OF TECHNOLOGY

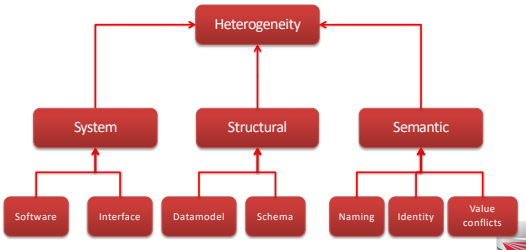
- Topics covered in this part
  - Heterogeneity and Autonomy
  - Data Integration Tasks
  - Data Integration Architectures (Methods)
  - Some Formal Background (sorry!)

2

1.1 Heterogeneity +Autonomy

ILLINOIS INSTITUTE OF TECHNOLOGY

- Taxonomy of Heterogeneity



3

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Hardware/Software
  - Different hardware capabilities of sources
  - Different protocols, binary file formats, …
  - Different access control mechanism
- Interface Heterogeneity
  - Different interfaces for accessing data from a source
    - HTML forms
    - XML-Webservices
    - Declarative language

4

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Hardware/Software
  - Different hardware capabilities of sources
    - **Mobile phone vs. server:** Cannot evaluate cross-product of two 1GB relations on a mobile phone
  - Different protocols, binary file formats, …
    - **Order information stored in text files:** line ending differs between Mac/Window/Linux, character encoding
  - Different access control mechanism
    - **FTP-access to files:** public, ssh authentication, ..

5

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity
  - Different interfaces for accessing data from a source
    - HTML forms
    - Services (SOA)
    - Declarative language
    - Files
    - Proprietary network protocol
    - …

6 CS520 - 1) Introduction

6

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Expressiveness
  - Keyword-search vs. query language
  - **Predicates**: equality (=), inequality (<, !=)
  - **Logical connectives**: conjunctive (AND), disjunctive (OR), negation
  - **Complex operations**: aggregation, quantification
  - **Limitations**: restriction to particular tables, predicates, fixed queries with parameters, …

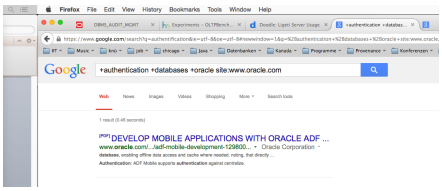
7 CS520 - 1) Introduction

7

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Examples
  - Google search (+/-, site:, intitle:, filetype:



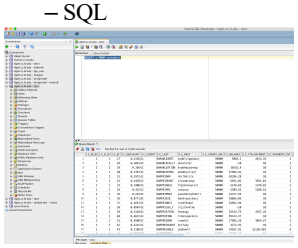
8 CS520 - 1) Introduction

8

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Examples
  - SQL



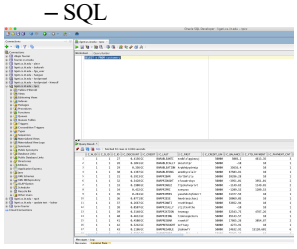
9 CS520 - 1) Introduction

9

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Examples
  - SQL



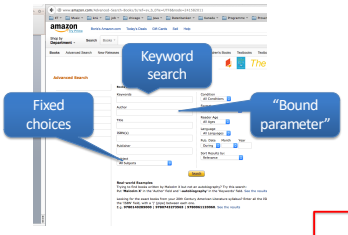
10 CS520 - 1) Introduction

10

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Examples
  - Web-form (with DB backend?)



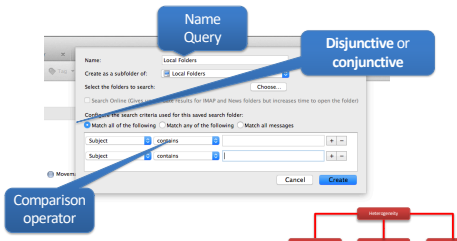
11 CS520 - 1) Introduction

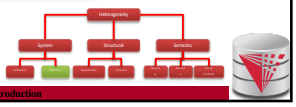
11

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Interface Heterogeneity – Examples
  - Email-client



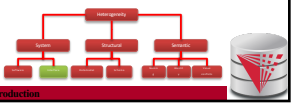


12

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Problems with interface heterogeneity
  - Global query language is more powerful
    - User queries may not be executable
    - Integration system has to evaluate part of the query
  - Bound parameters are incompatible with query
    - User query may not be executable

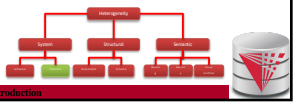


13

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Example: more expressive global language
  - SQL with one table
    - books (title, author, year, isbn, genre)
  - Web form for books about history shown below
  - What problems do may arise translating user queries?



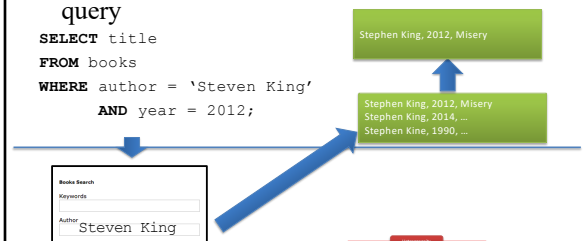
14

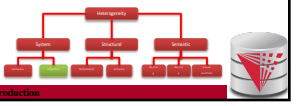
1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Integration system has to process part of the query

```
SELECT title
FROM books
WHERE author = 'Steven King'
      AND year = 2012;
```





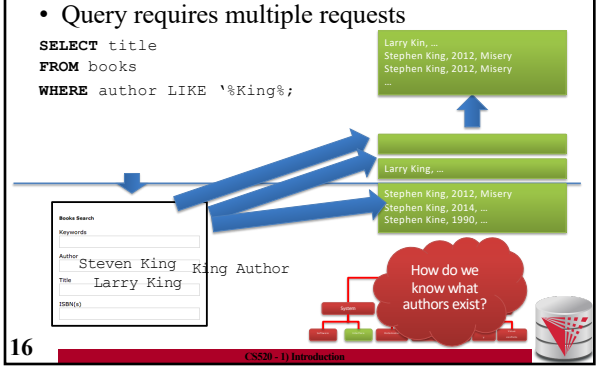
15

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Query requires multiple requests

```
SELECT title
FROM books
WHERE author LIKE '%King%;
```



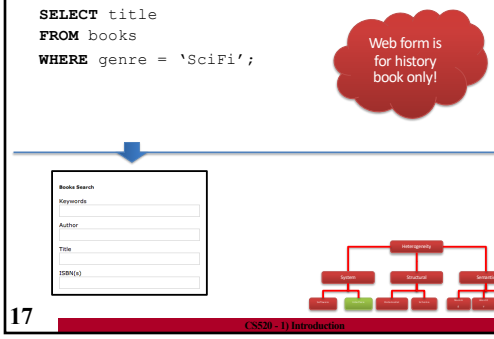
16

1.1 System Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Query cannot be answered

```
SELECT title
FROM books
WHERE genre = 'SciFi';
```

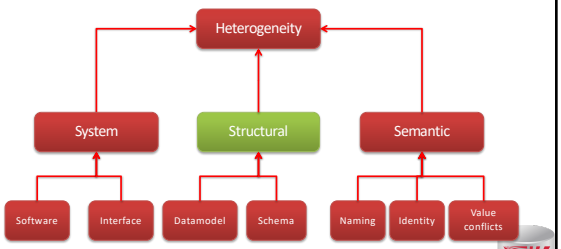


17

1.1 Heterogeneity +Autonomy

ILLINOIS INSTITUTE OF TECHNOLOGY

- Taxonomy of Heterogeneity



18

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Data model**
  - Different semantic/expressiveness
  - Different structure
- **Schema**
  - **Integrity constraints, keys**
  - **Schema elements**:
    - use attribute or separate relations)
  - **Structure**:
    - e.g., normalized vs. denormalized relational schema

19

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Data model**
  - Relational model
  - XML model
  - Object-oriented model
  - Ontological model
  - JSON
  - …

20

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Example: data model
  - Relational model
  - XML model
  - JSON
  - OO
- Person and their addresses

21

1.1 Structural Heterogeneity

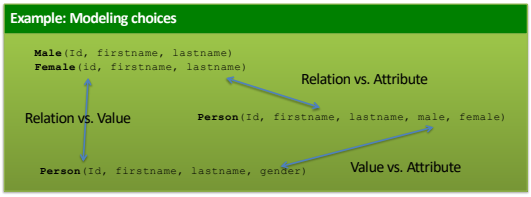
ILLINOIS INSTITUTE OF TECHNOLOGY

- **Schema**
  - Modeling choices
    - Relation vs. attribute
    - Attribute vs. value
    - Relation vs. value
  - Naming
  - Normalized vs. denormalized (relational concept)
  - Nesting vs. reference

22

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY



23

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Relation-relation conflicts**
  - Naming conflicts
    - Relations with different name representing the same data (**synonym**)
    - Relations with same name representing different information (**homonym**)
  - Structural conflicts
    - Missing attributes
    - Many-to-one
    - Missing, but derivable attributes
  - Integrity constraint conflicts

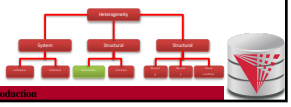
24

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

Example: Conflicts between relations

```
Person(Id, firstname, lastname, male, female)
Person(Id, name, gender, birthday)
Manager(Id, name, gender, age)
```



25

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

Mutliple attribtue vs one attribute

Example: Conflicts between relations

```
Person(Id, firstname, lastname, male, female)
Person(Id, name, gender, birthday)
Manager(Id, name, gender, age)
```

Missing derivable attribute: Role

Derivable attribute: Compute age from birthday

26

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Attribute-attribute conflicts**
  - Naming conflicts
    - Attributes with different name representing the same data (**synonym**)
    - Attributes with same name representing different information (**homonym**)
  - Default value conflict
  - Integrity constraint conflicts
    - Datatype
    - Constraints restricting values

27

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

Example: Conflicts between attributes and attributes

SSN	FirstName VARCHAR(40)	LastName	Age CHECK(Age > 18)
333-333-3333	Peter	Schmeter	30
333-333-9999	Hans	Glanz	NULL

SSN	FirstName VARCHAR(25)	SurName	Age
3333333333	Peter	Schmeter	30
3333339999	Hans	Glanz	-1

28

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

Example: Conflicts between attributes and attributes

SSN	FirstName VARCHAR(40)	LastName	Age CHECK(Age > 18)
333-333-3333	Peter	Schmeter	30
333-333-9999	Hans	Glanz	NULL

SSN	FirstName VARCHAR(25)	SurName	Age
3333333333	Peter	Schmeter	30
3333339999	Hans	Glanz	-1

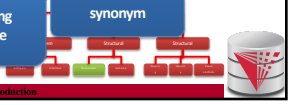
Conflicting constraint

Conflicting default value

Conflicting format

Conflicting datatype

synonym

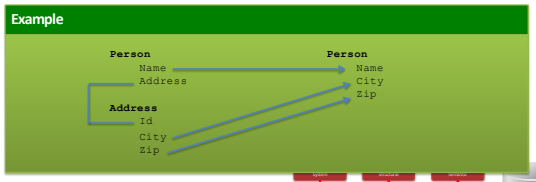


29

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Normalized vs. denormalized**
  - E.g., relational model: Association between entities can be represented using multiple relations and foreign keys or one relation

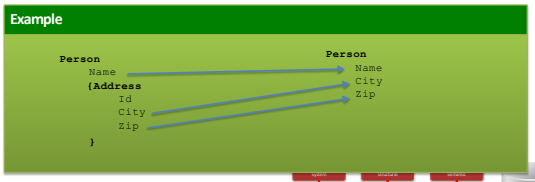


30

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Nested vs. flat**
  - Association between entities can be represented using nesting or references (previous slides)



31

1.1 Structural Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

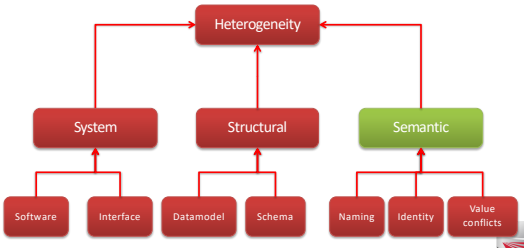
- **Problems caused by schema heterogeneity**
  - Unified access to multiple schemas or integrate schemas into new schema
    - **Schema level**: schema mapping, model management operators, schema languages
    - **Data Level:** virtual data integration, data exchange, warehousing (ETL)

32

1.1 Heterogeneity +Autonomy

ILLINOIS INSTITUTE OF TECHNOLOGY

- Taxonomy of Heterogeneity



33

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Semantic Heterogeneity**
  - Naming Conflicts
  - Identity Conflicts (Entity resolution)
  - Value Conflicts (Data Fusion)

34

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Naming Conflicts**
  - Ontological (concepts)
    - Birds vs. Animals
  - Synonyms
    - Surname vs. last name
  - Homonyms
  - Units
    - Gallon vs. liter
  - Values
    - Manager vs. Boss

35

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Ontological concepts**
  - Relationships between concepts
    - **A = B** - Equivalence
    - **A ⊆B** - Inclusion
    - **A ∩ B** - Overlap
    - **A ≠ B** - Disjunction

36

36

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Ontological concepts**
  - Relationships between concepts
    - **A = B** - Equivalence
    - **A ⊆B** - Inclusion
    - **A ∩ B** - Overlap
    - **A ≠ B** - Disjunction

Example

Equivalence: Human vs Homo sapiens
Inclusion: Bird vs Animal
Overlap: Animal vs aquatic lifeform
Disjunction: Fish vs Mamal

37

37

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Naming concepts (synonyms)**
  - **Different** words with **same meaning**

Example

Person(Name,Age)
Human(LastName,Age)

38

38

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Naming concepts (homonyms)**
  - **Same** words with **different meaning**

Example

Person(Title,Name)
Movie(Title,Year)

39

39

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Naming concepts (units)**

Example

Person(Title,Name,Salary) — $
Person(Title,Name,Salary) — CAD

40

40

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Identity Conflicts
  - What is an object?
    - E.g., multiple tuples in relational model
  - Central question:
    - Does object A represent the same entity as B
  - This problem has been called
    - **Entity resolution**
    - **Record linkage**
    - **Deduplication**
    - …

41

41

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- Identity Conflicts

Example

(IBM, 300000000, USA)

(International Business Machines Corporation, 50000)

42

1.1 Semantic Heterogeneity

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Value Conflicts**
  - Objects representing the same entities have conflicting values for semantically equivalent attributes
    - We have to identified that these objects are represent the same entitity first!
  - Resolving such conflicts requires **Data Fusion**
    - Pick value from conflicting values
    - Numerical methods: e.g., average
    - Preferred value
    - …

43

1.1 Autonomy

ILLINOIS INSTITUTE OF TECHNOLOGY

- **How autonomous are data sources**
  - One company
    - Can enforce, e.g., schema and software
  - …
  - The web
    - Website decides
      - Interface
      - Determines access restrictions and limits
      - Availability
      - Format
      - Query restrictions
      - …

44

1.2 Data integration tasks

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Cleaning and prepreparation**
- **Entity resolution**
- **Data Fusion**
- **Schema matching**
- **Schema mapping**
- **Query rewrite**
- **Data translation**

45

1.3 Data integration architectures

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Virtual data integration**
- **Data Exchange**
- **Peer-to-peer data integration**
- **Datawarehousing**
- **Big Data analytics**

46

1.4 Formal Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Query Equivalence**
  - Complexity for different query classes
- **Query Containment**
  - Complexity for different query classes
- **Datalog**
  - Recursion + Negation
- **Integrity Constraints**
  - Logical encoding of integrity constraints
- **Similarity Measures/Metrics**

47

1.4 Boolean Logic

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Boolean Logic (syntax)**
  - **Atomic formulas:**
    - Boolean constants (**true, false**)
    - Boolean Variables (can take Boolean constants as values)
  - **Formulas:**
    - Any atomic formula is also a formula
    - If ϕ, ψ are formulas then the following are also valid formulas:

$\neg \phi$ $\quad \phi \wedge \psi$

$\phi \vee \psi$ $\quad \phi \rightarrow \psi$

48

1.4 Boolean Logic

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Boolean Logic (semantics)**
  - **Valuation:**
    - Assign truth values to the variables of a formula
    - Under a valuation a formula evaluates to a Boolean value (true or false)
    - If there exists a valuation that makes the formula ψ true then the formula ψ is called **satisfiable**
  - **Semantics:**
    - Expected semantics of Boolean operators:

$$\top \wedge \bot = \bot$$
$$\top \wedge \top = \top$$
$$\bot \vee \top = \top$$
$$\ldots$$

49

1.4 Boolean Logic

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Formula:

$$(x \vee y) \wedge \neg z$$

A possible valuation:

$$\nu : x = \top, y = \bot, z = \top$$

Evaluating the formula:

$$(\top \vee \bot) \wedge \neg \top = \top \wedge \bot = \bot$$

50

1.4 First-order logic (FO)

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Concepts**
  - **Domain of discourse** $\mathbb{D}$
    - These are the values that we can bind variables to
    - Values from the domain can also be used as constants in formulas
  - **A set of predicate symbols (each with an arity)**

$$R_1, \ldots, R_n$$

    - These represent relations (in the mathematical sense)
  - **An infinite set of variables** $\mathcal{X}$

51

1.4 FO Syntax

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Terms**
  - **Variables:** any variable from $\mathcal{X}$ is a term
  - **Constants:** any constant from $\mathbb{D}$ is a term
- **Atomic formulas:**
  - For any n-ary predicate *R* and terms $t_1, \ldots, t_n$ $R(t_1, \ldots, t_n)$ is an atomic formula
- **Formulas:**
  - If ϕ, ψ are formulas then the following are also valid formulas:

$\psi \wedge \phi$ $\quad \psi \vee \phi$ $\quad \neg \phi$

$\psi \rightarrow \phi$ $\quad \exists x : \psi$ $\quad \forall x : \psi$

52

1.4 Free / Bound Variables

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Free variables of a formula**
  - All variables not bound by quantifiers

$$free(\neg\psi) = free(\psi)$$
$$free(\psi \wedge \phi) = free(\psi) \cup free(\phi)$$
$$free(\psi \vee \phi) = free(\psi) \cup free(\phi)$$
$$free(\forall x : \psi) = free(\psi) - \{x\}$$
$$free(\exists x : \psi) = free(\psi) - \{x\}$$
$$free(R(t_1, \ldots, t_n)) = free(t_1) \cup \ldots \cup free(t_n)$$
$$free(x) = \{x\}$$
$$free(c) = \emptyset$$

53

1.4 FO Semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

– **Model $\mathcal{M}$**
  - an interpretation of the predicates, i.e., we assign each predicate to a concrete relation
  - We select a domain of discourse $\mathbb{D}$

– **Valuations μ for a formula ψ**
  - Assigns free variables of ψ to values from $\mathbb{D}$

– **Substitutions**
  - Replace all free occurrences of variable x with c

$$\psi[x \leftarrow c]$$

54

1.4 FO Semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

– **Given a model $\mathcal{M}$ and valuation μ**
  - The "result" of a formula $[\![\psi]\!]_{\mathcal{M},\mu}$

$$\begin{aligned}
[\![c]\!]_{\mathcal{M},\mu} &= c \\
[\![x]\!]_{\mathcal{M},\mu} &= \mu(x) \\
[\![R(t_1,\ldots,t_n)]\!]_{\mathcal{M},\mu} &= \begin{cases} \top & \text{if } ([\![t_1]\!]_{\mathcal{M},\mu},\ldots,[\![t_n]\!]_{\mathcal{M},\mu}) \in R \\ \bot & \text{otherwise} \end{cases} \\
[\![\psi \wedge \phi]\!]_{\mathcal{M},\mu} &= [\![\psi]\!]_{\mathcal{M},\mu} \wedge [\![\phi]\!]_{\mathcal{M},\mu} \\
[\![\psi \vee \phi]\!]_{\mathcal{M},\mu} &= [\![\psi]\!]_{\mathcal{M},\mu} \vee [\![\phi]\!]_{\mathcal{M},\mu} \\
[\![\neg\, \psi]\!]_{\mathcal{M},\mu} &= \neg\, [\![\psi]\!]_{\mathcal{M},\mu} \\
[\![\exists x : \psi]\!]_{\mathcal{M},\mu} &= \bigvee_{c \in \mathbb{D}} : [\![\psi[x \leftarrow c]]\!]_{\mathcal{M},\mu} \\
[\![\forall x : \psi]\!]_{\mathcal{M},\mu} &= \bigwedge_{c \in \mathbb{D}} : [\![\psi[x \leftarrow c]]\!]_{\mathcal{M},\mu}
\end{aligned}$$

55

1.4 FO semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Formula: $\psi = \forall y : R(x,y)$

Model: $\mathcal{M} = \{R = \{(1,1),(1,2),(1,3)\}$
$\mathbb{D} = \{1,2,3\}\}$

Valuation: $\mu(x) = 1$

Result:
$[\![\forall y : R(x,y)]\!]_{\mathcal{M},\mu}$
$= [\![R(x,1)]\!]_{\mathcal{M},\mu} \wedge [\![R(x,2)]\!]_{\mathcal{M},\mu} \wedge [\![R(x,3)]\!]_{\mathcal{M},\mu}$
$= [\![(x,1)]\!]_{\mathcal{M},\mu} \in R \wedge [\![(x,2)]\!]_{\mathcal{M},\mu} \in R \wedge [\![(x,3)]\!]_{\mathcal{M},\mu} \in R$
$= (\mu(x),1) \in R \wedge (\mu(x),2) \in R \wedge (\mu(x),3) \in R$
$= (1,1) \in R \wedge (1,2) \in R \wedge (1,3) \in R$
$= \top \wedge \top \wedge \top$
$= \top$

56

1.4 FO Problems

ILLINOIS INSTITUTE OF TECHNOLOGY

– **Model checking**
  - Given a model $\mathcal{M}$ and formula ψ without free variables
  - Is $[\![\psi]\!]_{\mathcal{M},\mu}$ true?

– **Satisfiability**
  - Given a formula ψ does there exist a model $\mathcal{M}$ and valuation μ such that $[\![\psi]\!]_{\mathcal{M},\mu}$ is true?

57

1.4 Integrity constraints

ILLINOIS INSTITUTE OF TECHNOLOGY

- **You know some types of integrity constraints already**
  – **Functional dependencies**
    - **Keys are a special case**
  – **Foreign keys**
    - **We have not really formalized that**

58

1.4 Integrity constraints

ILLINOIS INSTITUTE OF TECHNOLOGY

- Other types are
  – Conditional functional dependencies
    - **E.g., used in cleaning**
  – Equality-generating dependencies
  – Multi-valued dependencies
  – Tuple-generating dependencies
  – Join dependencies
  – Denial constraints
  – …

59

1.4 Integrity constraints

ILLINOIS INSTITUTE OF TECHNOLOGY

- How to manage all these different types of constraints?
  - Has been shown that these constraints can be expressed in a logical formalism.
  - Formulas which consist of relational and comparison atoms. Variables represent values
    - R(x,y,z)
    - x = y

60

1.4 Integrity Constraints

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Primary Key R(A,B):

$$\forall x, y, z : R(x, y) \wedge R(x, z) \rightarrow y = z$$

Functional Dependency R(A,B) with A->B:

$$\forall x, y, z, a : R(x, y) \wedge R(z, a) \wedge x = z \rightarrow y = a$$

Foreign Key R(A,B), S(C,D) where D is FK to R:

$$\forall x, y : S(x, y) \rightarrow \exists z : R(y, z)$$

61

1.4 Integrity constraints

ILLINOIS INSTITUTE OF TECHNOLOGY

- Types of constraints we will use a lot
  - Tuple-generating dependencies (**tgds**)
    - Implication with conjunction of relational atoms
    - Foreign keys and schema mappings (later)

$$\forall \vec{x} : \phi(\vec{x}) \rightarrow \exists \vec{y} : \psi(\vec{x}, \vec{y})$$

  - Equality-generating dependencies (**egds**)
    - Generalizes keys, FDs

$$\forall \vec{x} : \phi(\vec{x}) \rightarrow \wedge_{k=1}^{n} x_{i_k} = x_{j_k}$$

62

1.4 Datalog

ILLINOIS INSTITUTE OF TECHNOLOGY

- What is Datalog?
  - Prolog for databases (syntax very similar)
  - A logic-based query language
- Queries (Program) expressed as set of rules

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

- One Q is specified as the answer relation (the relation returned by the query)

63

1.4 Datalog - Intuition

ILLINOIS INSTITUTE OF TECHNOLOGY

- A **Datalog rule**

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

- **Procedural Interpretation:** For all bindings of variables that makes the RHS true (conjunction) return bindings of $\vec{x}$

Example

```
Q(Name):- Person(Name,Age).
Return names of persons
```

64

1.4 Datalog - Syntax

ILLINOIS INSTITUTE OF TECHNOLOGY

- A **Datalog program** is a set of Datalog rules
  - Optionally a distinguished answer predicate
- A **Datalog rule** is

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

- **X's** are lists of variables and constants
- **Ri's** are relation names
- **Q** is a relation name

65

1.4 Datalog - Terminology

ILLINOIS INSTITUTE OF TECHNOLOGY

- Left-hand side of a rule is called it's **head**
- Right-hand side of a rule is called it's **body**
- Relation are called **predicates**
- $R(\vec{x})$ is called an **atom**
- An **instance** I of a database is the data
- The **active domain** adom(I) of an instance I is the set of all constants that occur in I

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

66

1.4 Datalog - Terminology

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q(N):- Person(N,A).

N, A are variables
Q(N), Person(N,A) are atoms
Person and Q are predicates
```

Name	Age
peter	34
bob	45

```
Activate domain
adom(I) = {peter,bob,34,45}
```

67

1.4 Datalog - Terminology

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Intensional** vs. **extensional**
  - Extensional database (**edb**)
    - What we usually call database
  - Intensional database (**idb**)
    - Relations that occur in the head of rules (are populated by the query)
  - Usually we assume that these do not overlap

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

68

1.4 Datalog - Safety

ILLINOIS INSTITUTE OF TECHNOLOGY

- A Datalog program is safe if all its rules are **safe**
- A rule is **safe** if all variables in $\vec{x}$ occur in at least one $\vec{x_i}$

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

Example

```
Q(Name):- Person(Name,Age).   (safe)
Q(Name,Sal):-Peron(Name,Age). (unsafe)
```

69

1.4 Datalog - Semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

- The instance of an idb predicate Q in a datalog program for an edb instance I contains all facts that can be derived by applying rules with Q in the head
- A rule derives a fact Q(c) if we can find a binding of variables of the rule to constants from adom(I) such that x is bound to c and the body is true

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

70

1.4 Datalog - Semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q(N):- Person(N,A).

N=peter,A=peter: Q(peter):- Person(peter,peter).
N=peter,A=bob: Q(peter):- Person(peter,bob).
N=peter,A=34: Q(peter):- Person(peter,34).
N=bob,A=peter: Q(bob):- Person(peter,peter).
N=bob,A=bob: Q(bob):- Person(peter,bob).
N=bob,A=34: Q(bob):- Person(bob,34).
N=34,A=peter: Q(34):- Person(34,peter).
N=34,A=bob: Q(34):- Person(34,bob).
N=34,A=34: Q(34):- Person(34,34).
```

N
peter
bob

```
Active domain
adom(I) = {peter,bob,34}
```

Name	Age
peter	34
bob	34

71

1.4 Datalog

ILLINOIS INSTITUTE OF TECHNOLOGY

- Different flavors of datalog
  - **Conjunctive query**
    - Only one rule
    - Expressible as Select-project-join (SPJ) query in relational algebra (only equality and AND in selection)
  - **Union of conjunctive queries**
    - Also allow union
    - SPJ + set union in relational algebra
    - Rules with the same head in Datalog
  - **Conjunctive queries with inequalities**
    - Also allow inequivalities, e.g., <

72

1.4 Datalog

ILLINOIS INSTITUTE OF TECHNOLOGY

- Different flavors of datalog
  - **Recursion**
    - Rules may have recursion:
      - E.g., head predicate in the body
    - Fixpoint semantics based on immediate consequence operator
  - **Negation (first-order queries)**
    - Negated relational atoms allowed
    - Require that every variable used in a negated atom also occurs in at least on positive atom (**safety**)
  - **Combined Negation + recursion**
    - Stronger requirements (e.g., stratification)

73

1.4 Datalog – Semantics (Negation)

ILLINOIS INSTITUTE OF TECHNOLOGY

- A rule derives a fact Q(c) if we can find a binding of variables of the rule to constants from adom(I) such that x is bound to c and the body is true
- A negated atom not R(X) is true if R(X) is not part of the instance

$$Q(\vec{x}) : -R_1(\vec{x_1}), \ldots, R_n(\vec{x_n}).$$

74

1.4 Datalog - Semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q(N):- Person(N,A), not Lives(N).
```

```
N=peter,A=peter: Q(peter):- Person(peter,peter),
                            not Lives(peter).
N=peter,A=bob: Q(peter):- Person(peter,bob),
                          not Lives(peter).
...
N=peter,A=34: Q(bob):- Person(bob,34),
                       not Lives(bob).
...
```

Active domain
adom(I) = {peter,bob,34}

Result

N
bob

Lives

Name
peter

Person

Name	Age
peter	34
bob	34

75

1.4 Datalog

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Relation **hop(A,B)** storing edges of a graph.

Q_{2hop}(x,z): hop(x,y),hop(y,z).

Q_{reach}(x,y): hop(x,y).
Q_{reach}(x,z): Q_{reach}(x,y),Q_{reach}(y,z).

Q_{node}(x): hop(x,y).
Q_{node}(x): hop(y,x).

76

1.4 Datalog

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Relation **hop(A,B)** storing edges of a graph.

Q_{node}(x): hop(x,y).
Q_{node}(x): hop(y,x).

$Q_{notReach}$(x,y): Q_{node}(x), Q_{node}(y),
not Q_{reach}(x,y).

77

1.4 Datalog versus FO

ILLINOIS INSTITUTE OF TECHNOLOGY

- A Datalog rule is a FO implication:

$$Q(X,Y) :- R(X,Z), R(Z,Y).$$

Means

$$\forall x, y : \exists z : R(x,z) \wedge R(z,y) \rightarrow Q(x,y)$$

- Databases can be expressed as rules!

$$R = \{(Peter, Bob), (Bob, Alice)\}$$

$$R(Peter, Bob) :-$$
$$R(Bob, Alice) :-$$

78

1.4 Model-theoretic semantics

ILLINOIS INSTITUTE OF TECHNOLOGY

- The result of a Datalog program P is the smallest model $\mathcal{M}$ for the program if interpreted as a logical formula

79

1.4 Containment and Equivalence

ILLINOIS INSTITUTE OF TECHNOLOGY

Definition: Query Equivalence

Query Q is equivalent to Q' iff for every database instance I both queries return the same result

$$Q \equiv Q' \Leftrightarrow \forall I : Q(I) = Q'(I)$$

Definition: Query Containment

Query Q is contained in query Q' iff for every database instance I the result of Q is contained in the result of Q'

$$Q \sqsubseteq Q' \Leftrightarrow \forall I : Q(I) \subseteq Q'(I)$$

80

1.4 Equivalence

ILLINOIS INSTITUTE OF TECHNOLOGY

- The problem of checking query equivalence is of different complexity depending on the **query language** and whether we consider **set or bag semantics**

81

1.4 Containment and Equiv.

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q1(x,y): R(x,y), R(x,z).
Q2(x,y): R(x,y).
Q3(x,x): R(x,x).
Q4(x,y): R(x,y).
Q5(x,x): R(x,y), R(x,x).
Q6(x,z): R(x,y), R(y,z).
```

82

1.4 Containment and Equiv.

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Relation **hop(A,B)** storing edges of a graph.

```
Q2hop(x,z): hop(x,y),hop(x,z).

Qup2Hop(x,z): hop(x,y),hop(x,z).
Qup2Hop(x,z): hop(x,z).

Qsym(x,y): hop(x,y).
Qsym(x,y): hop(y,x).
Qsym2Hop(x,y): Qsym(x,y),Qsym(y,z).
```

83

1.4 Complexity of Eq. and Cont.

ILLINOIS INSTITUTE OF TECHNOLOGY

Set semantics	Relational Algebra	Conjunctive Queries (CQ)	Union of Conjunctive Queries (UCQ)	Monotone Queries/ CQ≠
Query Evaluation (Combined Complexity)	PSPACE-complete	NP-complete	NP-complete	NP-complete
Query Evaluation (Data Complexity)	LOGSPACE (that means in P)	LOGSPACE (that means in P)	LOGSPACE (that means in P)	LOGSPACE (that means in P)
Query Equivalence	Undecidable	NP-complete	NP-complete	Π_2^P-complete
Query Containment	Undecidable	NP-complete	NP-complete	Π_2^P-complete

84

1.4 Complexity of Eq. and Cont.

ILLINOIS INSTITUTE OF TECHNOLOGY

Bag semantics	Relational Algebra	Conjunctive Queries (CQ)	Union of Conjunctive Queries (UCQ)
Query Equivalence	Undecidable	Equivalent to graph isomorphism	Undecidable
Query Containment	Undecidable	Open Problem	Undecidable

85

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

- NP-completeness for set semantics CQ and UCQ for the containment, evaluation, and equivalence problems is based on reducing these problems to the same problem
  - **[Chandra & Merlin, 1977]**
- Notational Conventions:
  - **head(Q)** = variables in head of query Q
  - **body(Q)** = atoms in body of Q
  - **vars(Q)** = all variable in Q

86

1.4 Boolean Conjunctive Queries

ILLINOIS INSTITUTE OF TECHNOLOGY

- A conjunctive query is boolean if the head does not have any variables
  - **Q() :- hop(x,y), hop(y,z)**
  - We will use Q :- … as a convention for Q() :- …
  - What is the result of a boolean query
    - Empty result {}, e.g., no **hop(x,y), hop(y,z)**
    - If there are tuples matching the body, then a tuple with zero attributes is returned {()}
  - -> We interpret {} as **false** and {()} as **true**
  - Boolean query is essentially an existential check

87

1.4 Boolean Conjunctive Queries

ILLINOIS INSTITUTE OF TECHNOLOGY

- BCQ in SQL

Example

```
Hop relation: Hop(A,B)

Q :- hop(x,y)

SELECT EXISTS (SELECT * FROM hop)

Note: in Oracle and DB2 we need a
from clause
```

88

1.4 Boolean Conjunctive Queries

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
SELECT
    CASE WHEN EXISTS (SELECT *
                      FROM hop)
    THEN 1 ELSE 0
    END AS x
FROM dual;

Notes:
- Oracle and DB2 FROM not optional
- Oracle has no boolean datatype
```

89

1.4 Boolean Conjunctive Queries

ILLINOIS INSTITUTE OF TECHNOLOGY

- BCQ in SQL

Example

```
Q :- hop(x,y), hop(y,z)

SELECT EXISTS
     (SELECT *
     FROM hop l, hop r
     WHERE l.B = r.A)
```

90

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

- How to check for containment of CQs (set)

Definition: Variable Mapping

A variable mapping ψ from query Q to query Q' maps the variables of Q to constants or variables from Q'

Definition: Containment Mapping

A containment mapping from query Q to Q' is a variable mapping ψ such that:

$$\Psi(head(Q)) = head(Q')$$

$$\forall R(\vec{x_i}) \in body(Q) : \Psi(R(\vec{x_i})) \in body(Q')$$

91

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Theorem: Containment Mappings and Query Containment

Query Q is contained in query Q' iff there exists a containment mapping ψ from Q' to Q

$$Q \sqsubseteq Q' \Leftrightarrow \exists \Psi : \Psi \text{ is a containment mapping } Q' \to Q$$

Example

```
Q1(u,z): R(u,z).
Q2(x,y): R(x,y).
```

Can we find a containment mapping?

92

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Theorem: Containment Mapping and Query Containment

Query Q is contained in query Q' iff there exists a containment mapping ψ from Q' to Q

Example

```
Q1(u,z): R(u,z).
Q2(x,y): R(x,y).

Q1 -> Q2 :Ψ(u)=x, Ψ(z)=y
Q2 -> Q1 :Ψ(x)=u, Ψ(y)=z
```

93

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q1(a,b): R(a,b), R(b,c).
Q2(x,y): R(x,y).
```

94

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

```
Q1(a,b): R(a,b), R(b,c).
Q2(x,y): R(x,y).

Do containment mappings exist?
```

Q1 -> Q2: none exists
Q2 -> Q1: Ψ(x)=a, Ψ(y)=b

95

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

$Q_1(a,b)$: R(a,b), R(c,b).
$Q_2(x,y)$: R(x,y).

$Q_1 \rightarrow Q_2$:Ψ(a)=x, Ψ(b)=y, Ψ(c)=x
$Q_2 \rightarrow Q_1$:Ψ(x)=a, Ψ(y)=b

96 CS520 - 1) Introduction

96

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- It was shown that query evaluation, containment, equivalence as all reducible to homomorphism checking for CQ
  - Canonical conjunctive query Q^I for instance I
    - Interpret attribute values as variables
    - The query is a conjunction of all atoms for the tuples
    - **I = {hop(a,b), hop(b,c)} -> Q^I :- hop(a,b), hop(b,c)**
  - Canonical instance I^Q for query Q
    - Interpret each conjunct as a tuple
    - Interpret variables as constants
    - **Q :- hop(a,a) -> I^Q = {hop(a,a)}**

97 CS520 - 1) Introduction

97

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- Containment Mapping <-> Containment
- Proof idea (boolean queries)
  - (if direction)
    - Assume we have a containment mapping Q_1 to Q_2
    - Consider database D
    - $Q_2(D)$ is true then we can find a mapping from vars(Q_2) to D
    - Compose this with the containment mapping and prove that this is a result for Q_1

98 CS520 - 1) Introduction

98

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

$Q_1()$: R(a,b), R(c,b).
$Q_2()$: R(x,y).
$Q_2 \rightarrow Q_1$:Ψ(x)=a, Ψ(y)=b

D={R(1,1), R(1,2)}

$Q_1(D)$={(1,1),(1,2)}
φ(a)=1, φ(b)=2, φ(c)=1

Ψφ(x)=1, Ψφ(y)=2

99 CS520 - 1) Introduction

99

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- Containment Mapping <-> Containment
- Proof idea (boolean queries)
  - (only-if direction)
    - Assume Q_2 contained in Q_1
    - Consider canonical (frozen) database I^{Q2}
    - Evaluating Q_1 over I^{Q2} and taking a variable mapping that is produced as a side-effect gives us a containment mapping

100 CS520 - 1) Introduction

100

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

$Q_1()$: R(a,b), R(c,b).
$Q_2()$: R(x,y).
$Q_2 \rightarrow Q_1$:Ψ(x)=a, Ψ(y)=b

I^{Q1} = {(a,b),(c,b)}

$Q_2(I^{Q1})$={()}
φ(x)=a, φ(y)=b

φ is our containment mapping Ψ

101 CS520 - 1) Introduction

101

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- If you are not scared and want to know more:
  - Look up Chandra and Merlins paper(s)
  - The text book provides a more detailed overview of the proof approach
  - Look at the slides from Phokion Kolaitis excellent lecture on database theory
    - https://classes.soe.ucsc.edu/cmps277/Winter10/

102

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- A more intuitive explanation why containment mappings work
  - Variable naming is irrelevant for query results
  - If there is a containment mapping Q to Q'
    - Then every condition enforced in Q is also enforced by Q'
    - Q' may enforce additional conditions

103

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

$Q_1()$: **R(a,b)**, R(c,b).
$Q_2()$: **R(x,y)**.
Q_2 -> Q_1 :Ψ(x)=a, Ψ(y)=b

If there exists tuples
R(a,b) and R(c,b)
in R that make Q_1 true, then we take
R(a,b)
to fulfill Q_2

104

1.4 Containment Background

ILLINOIS INSTITUTE OF TECHNOLOGY

- From boolean to general conjunctive queries
  - Instead of returning true or false, return bindings of variables
  - Recall that containment mappings enforce that the head is mapped to the head
  - -> same tuples returned, but again Q' s condition is more restrictive

105

1.4 Containment Mappings

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

Q_1(**a**): **R(a,b)**, R(c,b).
Q_2(**x**): **R(x,y)**.
Q_2 -> Q_1 :Ψ(x)=a, Ψ(y)=b

For every
R(a,b) and R(c,b)
Q_1 returns (a) and for every
R(a,b)
Q_2 returns (a)

106

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Problem faced by multiple integration tasks**
  - Given two objects, how similar are they
  - **E.g., given two attribute names in schema matching, given two values in data fusion/entity resolution, …**

107

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Object models**
  - **Multidimensional (feature vector model)**
    - Object is described as a vector of values - one for each dimension out of a given set of dimensions
    - E.g., Dimensions are gender (male/female), age (0-120), and salary (0-1,000,000). An example object is [male,80,70,000]
  - **Strings**
    - E.g., how similar is "Poeter" to "Peter"
  - **Graphs and Trees**
    - E.g., how similar are two XML models

108

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

Definition: Similarity Measure

Function d(p,q) where p and q are objects, that returns a real score with
- d(p,p) = 0
- d(p,q) >= 0

Note: often scores are normalized to the range [0,1]

109

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

Example

String equality: d(p,q) = 0 if p=q
strings d(p,q) = 1 else

Euclidian distance: d(p,q) = $\sqrt{\sum_{i=1}^{n}(p[i]-q[i])^2}$
N-dimensional space

Edit distance: d(p,q) = minimum number of
strings single character
insertions, deletions,
replacements to
transform p into q

110

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

Definition: Metric

Function d(p,q) where p and q are objects, that returns a real score with

Non-negative	d(p,q) >= 0
Symmetry	d(p,q) = d(q,p)
Identity of indiscernibles	d(p,q) = 0 iff p=q
Triangle inequality	d(p,q) + d(q,r) >= d(p,r)

111

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

Definition: Metric

Function d(p,q) where p and q are objects, that returns a real score with

Non-negative	d(p,q) >= 0
Symmetry	d(p,q) = d(q,p)
Identity of indiscernibles	d(p,q) = 0 iff p=q
Triangle inequality	d(p,q) + d(q,r) >= d(p,r)

112

1.4 Similarity Measures

ILLINOIS INSTITUTE OF TECHNOLOGY

- **Why do we care whether d is a metric?**
  - Some data mining algorithms only work for metrics
    - **E.g., some clustering algorithms such as k-means**
    - **E.g., clustering has been used in entity resolution**
  - Metric spaces allow optimizations of some methods
    - **E.g., Nearest Neighboorhood-search: find the most similar object to an object p. This problem can be efficiently solved using index structures that only apply to metric spaces**

113

Summary

ILLINOIS INSTITUTE OF TECHNOLOGY

- Heterogeneity
  - Types of heterogeneity
  - Why do they arise?
  - Hint at how to address them
- Autonomy
- Data Integration Tasks
- Data Integration Architectures
- Background
  - Datalog + Query equivalence/containment + Similarity + Integrity constraints
