

ILLINOIS INSTITUTE

6. What is Datawarehousing?

Store data in a different system (the datawarehouse) for analysis

concurrency control during analysis Heterogeneity and Distribution – Preprocess data coming from transactional databases to clean it and translate it into a unified

format before bulk-loading

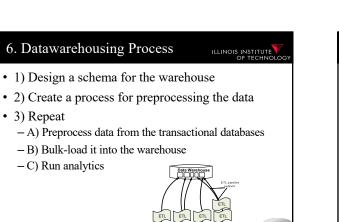

- Bulk-load data to avoid wasting performance on

Solution:Performance

3

| 6 | . What is Datawarehousing? |
|---|---|
| • | Problem: Data Analysis, Prediction, Mining |
| | – Example: Walmart |
| | - Transactional databases |
| | Run many "cheap" updates concurrently |
| | • E.g., each store has a database storing its stock and sales |
| | - Complex Analysis over Transactional Databases? |
| | Want to analyze across several transactional databases E.g., compute total Walmart sales per month Distribution and heterogeneity |
| | Want to run complex analysis over large datasets Resource consumption of queries affects normal operations on transactional databases |
| 2 | CNS20 - 0) Data Warehousing |

| 6. Overview | ILLINOIS INSTITUTE |
|---|--------------------|
| The multidimensional datamediate Multidimensional data model Relational implementations | odel (cube) |
| • Preprocessing and loading (E | TL) |
| • Query language extensions – ROLL UP, CUBE, | |
| Query processing in dataware Bitmap indexes | ehouses |
| Query answering with views Self-tuning | |
| _ | |
| 5 CS520 - 6) Data Warehous | ing 🛛 |
| | |

6. Multidimensional Datamodel

• Analysis queries are typically aggregating lower level facts about a business

- The revenue of Walmart in each state (country, city)
- The amount of toy products in a warehouse of a company per week
- The call volume per zip code for the Sprint network

-...

6. Multidimensional Datamodel

- Commonality among these queries:
 - At the core are facts: a sale in a Walmart store, a toy stored in a warehouse, a call made by a certain phone
 - Data is aggregated across one or more dimensions
 These dimensions are typically organized hierarchically: year - month - day - hour, country - state - zip
- Example

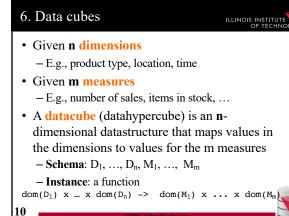

7

- The revenue (sum of sale amounts) of Walmart in each state

6. Generalization to multiple dimensions Given a fixed number of dimensions E.g., product type, location, time 6 Given some measure E.g., number of sales, items in stock, ... 9 In the multidimensional datamodel we store facts: the values of measures for a combination of values for the dimensions

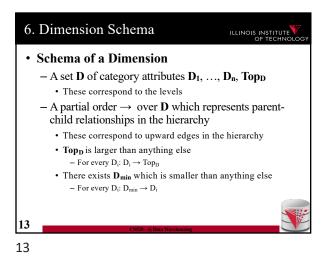

9

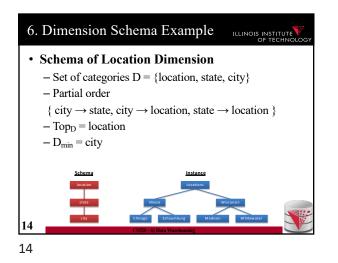

6. Dimensions Illinois Institute of Technol

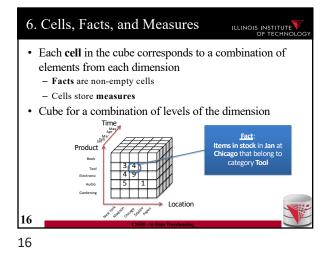

Purpose

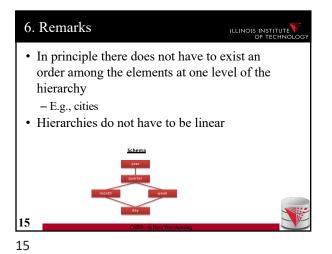

- Selection of descriptive data
- Grouping with desired level of granularity
- A dimension is define through a **containmenthierarchy**
- Hierarchies typically have several levels
- The **root level** represents the whole dimensions
- We may associate additional descriptive information with a elements in the hierarchy (e.g., number of residents in a city)

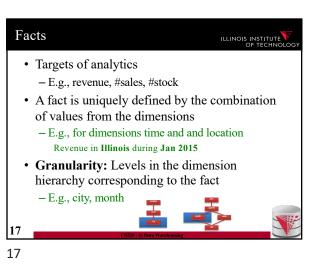

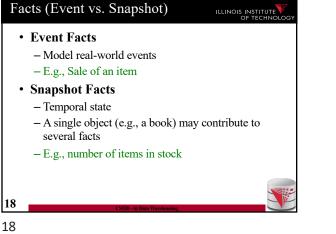

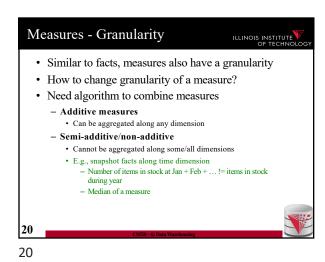

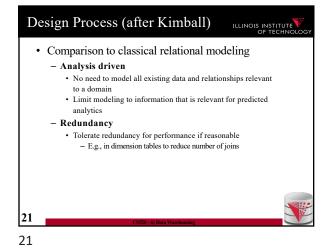

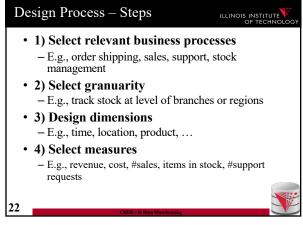

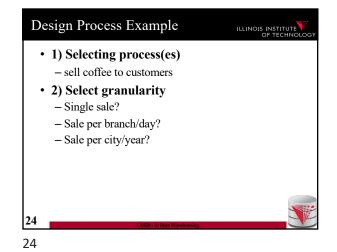

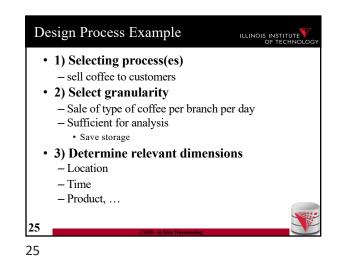

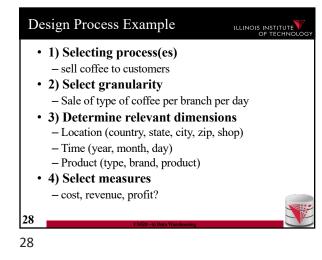

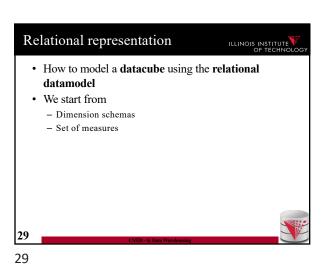

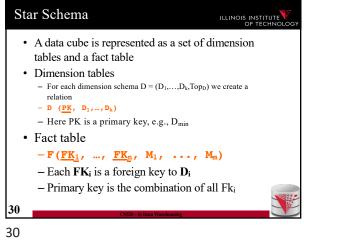

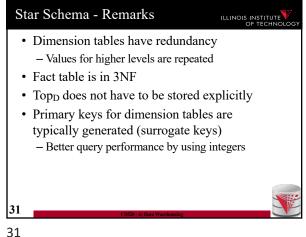

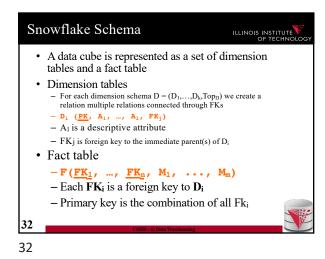

Design Process Example Design Process Example ILLINOIS INSTITUTE ILLINOIS INSTITUTE • 1) Selecting process(es) • 1) Selecting process(es) - sell coffee to customers - sell coffee to customers • 2) Select granularity • 2) Select granularity - Sale of type of coffee per branch per day - Sale of type of coffee per branch per day • 3) Determine relevant dimensions • 3) Determine relevant dimensions - Location (country, state, city, zip, shop) - Location (country, state, city, zip, shop) - Time (year, month, day) - Time (year, month, day) - Product (type, brand, product) - Product (type, brand, product) • 4) Select measures 26 27 27 26
