

# Array Element Assignments

*CS 536: Science of Programming, Fall 2021*

## A. Why?

- Array assignments aren't like assignments to plain variables because the actual item to change can't be determined until runtime. We can handle this by extending our notion of assignment and/or substitution.

## B. Outcomes

At the end of this work you should:

- Be able to perform textual substitution to replace an array element.
- Be able to calculate the  $wp$  of an array element assignment.

## C. Questions

For each of the questions below, calculate the given weakest precondition. Then try logically simplifying it to something easier to read.

1. Calculate  $wp(b[0] := 9, x > b[k]).$
2. Calculate  $wp(b[k] := b[j], b[m] = 0).$
3. Calculate  $wp(b[k] := b[j], b[j] = z).$
4. Calculate  $wp(b[k] := 1, b[k] = b[j]).$
5. Calculate  $wp(b[k] := x; b[j] := y, b[k] \neq b[j]).$
6. Calculate  $wp(b[k] := x, b[b[k]] \neq b[k]).$
7. Is the triple  $\{k < b[k] < b[j]\} b[b[k]] := b[j] \{b[k] \neq b[j]\}$  valid?
8. Define a predicate function  $swapped(b_1, b_2, k, j)$  that yields true iff  $b_1$  and  $b_2$  are equal except their values at  $k$  and  $j$  are swapped.
9. Let the function  $search(b, m, n, x) = k$  where if  $m \leq k \leq n$  then  $b[k] = x$  and if  $k < m \vee k > n$ , then no index for  $x$  exists in the range  $m \dots n$ . (I.e., for all  $j$  where  $m \leq j \leq n$ , we have  $b[j] \neq x$ .) Complete the predicate  $\exists k . search(b, m, n, x) = k \rightarrow \dots$  so that the ellipsed section formalizes this description of what  $search$  does.

*Solution to Practice 21 (Array Element Assignments)*

1.  $\wp(b[0] := 9, \ x > b[k]) \equiv (x > b[k])[9/b[0]]$   
 $\equiv x > \text{if } k = 0 \text{ then } 9 \text{ else } b[k] \text{ fi}$   
 $\Leftrightarrow \text{if } k = 0 \text{ then } x > 9 \text{ else } x > b[k] \text{ fi}$   
 $\Leftrightarrow (k = 0 \wedge x > 9) \vee (k \neq 0 \wedge x > b[k])$
2.  $\wp(b[k] := b[j], \ b[m] = 0) \equiv (b[m] = 0)[b[j]/b[k]]$   
 $\equiv \text{if } m = k \text{ then } b[j] \text{ else } b[m] \text{ fi} = 0$   
 $\Leftrightarrow \text{if } m = k \text{ then } b[j] = 0 \text{ else } b[m] = 0 \text{ fi} \text{ (one possible alternative rewriting)}$   
 $\Leftrightarrow (m = k \rightarrow b[j] = 0) \wedge (m \neq k \rightarrow b[m] = 0) \quad \text{(another possible alternative rewriting)}$
3.  $\wp(b[k] := b[j], \ b[j] = z) \equiv (b[j] = z)[b[j]/b[k]]$   
 $\equiv \text{if } j = k \text{ then } b[j] \text{ else } b[j] \text{ fi} = z$   
 $\Leftrightarrow b[j] = z$
4.  $\wp(b[k] := 1, \ b[k] = b[j]) \equiv (b[k] = b[j])[1/b[k]]$   
 $\equiv (b[k])[1/b[k]] = (b[j])[1/b[k]]$   
 $\equiv 1 = (\text{if } j = k \text{ then } 1 \text{ else } b[j] \text{ fi})$   
 $\Leftrightarrow k = j \vee b[j] = 1 \quad (\Leftrightarrow k \neq j \rightarrow b[j] = 1 \text{ if you prefer } \rightarrow \text{ to } \vee)$
5.  $\wp(b[k] := x; b[j] := y, \ b[k] \neq b[j])$   
 $\equiv \wp(b[k] := x, \ \wp(b[j] := y, \ b[k] \neq b[j]))$

For the embedded  $\wp$ ,  $\wp(b[j] := y, \ b[k] \neq b[j])$

$$\begin{aligned} &\equiv (b[k] \neq b[j])[y/b[j]] \\ &\equiv b[k][y/b[j]] \neq b[j][y/b[j]] \\ &\equiv \text{if } k = j \text{ then } y \text{ else } b[k] \text{ fi} \neq y \\ &\Leftrightarrow k \neq j \wedge b[k] \neq y \end{aligned}$$

So  $\wp(b[k] := x, \ \wp(b[j] := y, \ b[k] \neq b[j]))$

$$\begin{aligned} &\Leftrightarrow \wp(b[k] := x, k \neq j \wedge b[k] \neq y) \\ &\equiv (k \neq j \wedge b[k] \neq y)[x/b[k]] \\ &\equiv k \neq j \wedge b[k][x/b[k]] \neq y \\ &\equiv k \neq j \wedge x \neq y \end{aligned}$$

Intuitively, if  $k = j$ , then we can't have  $b[k] \neq b[j]$ . Even if  $k \neq j$ , we need  $x \neq y$  to ensure that the assignments  $b[k] := x; b[j] := y$  make  $b[k] \neq b[j]$ .

6. For  $\wp(b[k] := x, b[b[k]] \neq b[k])$ , let's first look at substituting  $x$  for  $b[k]$  in  $b[b[k]]$ . It's complicated because we have to recursively substitute in the index of the outer  $b[\dots]$ . The general rule is

$$(b[e_2])[e_1/b[e_0]] \equiv (\text{if } e_2' = e_0 \text{ then } e_1 \text{ else } b[e_2'] \text{ fi}) \text{ where } e_2' \equiv (e_2)[e_1/b[e_0]]$$

So let  $e' \equiv (b[k]) [x/b[k]] \equiv x$ , so

$$\begin{aligned} & (b[b[k]]) [x/b[k]] \\ & \equiv \text{if } e' = k \text{ then } x \text{ else } b[e'] \text{ fi} \\ & \equiv \text{if } x = k \text{ then } x \text{ else } b[x] \text{ fi} \end{aligned}$$

Then

$$\begin{aligned} & wp(b[k] := x, b[b[k]] \neq b[k]) \\ & \equiv (b[b[k]] \neq b[k]) [x/b[k]] \\ & \equiv (b[b[k]]) [x/b[k]] \neq (b[k]) [x/b[k]] \\ & \equiv \text{if } x = k \text{ then } x \text{ else } b[x] \text{ fi} \neq x \\ & \Leftrightarrow x \neq k \wedge b[x] \neq x \end{aligned}$$

7. For the triple to be valid, it's sufficient to show that its precondition implies the wp of the assignment and postcondition. I.e.,  $k < b[k] < b[j] \rightarrow wp(b[b[k]] := b[j], b[k] \neq b[j])$

First let's calculate  $wp(b[b[k]] := b[j], b[k] \neq b[j])$

$$\begin{aligned} & \equiv (b[k] \neq b[j]) [b[j] / b[b[k]]] \\ & \equiv (b[k]) [b[j] / b[b[k]]] \neq (b[j]) [b[j] / b[b[k]]] \\ & \equiv \text{if } k = b[k] \text{ then } b[j] \text{ else } b[k] \text{ fi} \neq \text{if } j = b[k] \text{ then } b[j] \text{ else } b[j] \text{ fi} \\ & \Leftrightarrow \text{if } k = b[k] \text{ then } b[j] \text{ else } b[k] \text{ fi} \neq b[j] \\ & \Leftrightarrow \text{if } k = b[k] \text{ then } b[j] \neq b[j] \text{ else } b[k] \neq b[j] \text{ fi} \\ & \Leftrightarrow k \neq b[k] \wedge b[k] \neq b[j] \end{aligned}$$

Going back to our original question, if the implication below is valid, then our triple is valid (because we have the precondition of the triple implying the wp of its body and postcondition).

$$\begin{aligned} & k < b[k] < b[j] \rightarrow wp(b[b[k]] := b[j], b[k] \neq b[j]) \\ & \Leftrightarrow k < b[k] < b[j] \rightarrow k \neq b[k] \wedge b[k] \neq b[j] \\ & \Leftrightarrow T \end{aligned}$$

So our original triple is indeed valid.

8.  $\text{swapped}(b_1, b_2, k, j) \equiv b_1[k] = b_2[j] \wedge b_1[j] = b_2[k] \wedge (\forall m. (m \neq k \wedge m \neq j \rightarrow b_1[m] = b_2[m]))$
9.  $\exists k. \text{search}(b, m, n, x) = k$   
 $\rightarrow (m \leq k \leq n \rightarrow b[k] = x) \wedge (m > k \vee k > n \rightarrow (\forall j. m \leq j \leq n \rightarrow b[j] \neq x))$
- (Extra parentheses added for readability)
