Instructions

• Try to answer all the questions using what you have learned in class
• **When writing a query, write the query in a way that it would work over all possible database instances and not just for the given example instance!**
• Some questions are marked as bonus. You do not have to answer these questions to get full points for the assignment. However, you can get bonus points for these questions!

Consider the following database schema and example instance:

**beer**

<table>
<thead>
<tr>
<th>bName</th>
<th>alcohol</th>
<th>type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schmecks</td>
<td>5.9</td>
<td>wheat</td>
</tr>
<tr>
<td>Lecker</td>
<td>3.5</td>
<td>ale</td>
</tr>
<tr>
<td>Bass</td>
<td>4.6</td>
<td>IPA</td>
</tr>
</tbody>
</table>

**wine**

<table>
<thead>
<tr>
<th>wName</th>
<th>alcohol</th>
<th>type</th>
<th>dryness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enttaler</td>
<td>12.0</td>
<td>white</td>
<td>semi-dry</td>
</tr>
<tr>
<td>HippiHope</td>
<td>18.05</td>
<td>red</td>
<td>sweet</td>
</tr>
</tbody>
</table>

**producesBeer**

<table>
<thead>
<tr>
<th>bName</th>
<th>cName</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schmecks</td>
<td>Beer Inc.</td>
</tr>
<tr>
<td>Lecker</td>
<td>Moselwine</td>
</tr>
<tr>
<td>Bass</td>
<td>Beer Inc.</td>
</tr>
</tbody>
</table>

**producesWine**

<table>
<thead>
<tr>
<th>wName</th>
<th>cName</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enttaler</td>
<td>Moselwine</td>
</tr>
<tr>
<td>HippiHope</td>
<td>Caliwine</td>
</tr>
</tbody>
</table>

**company**

<table>
<thead>
<tr>
<th>cName</th>
<th>country</th>
<th>numEmpl</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beer Inc.</td>
<td>USA</td>
<td>10,000</td>
</tr>
<tr>
<td>Caliwine</td>
<td>USA</td>
<td>5,500</td>
</tr>
<tr>
<td>Moselwine</td>
<td>Germany</td>
<td>3,000</td>
</tr>
</tbody>
</table>

Hints:

• Underlined attribute form the primary key of a relation
• The attribute *bName* of relation *producesBeer* is a foreign key to *bName* in relation *beer*. The attribute *cName* of relation *producesBeer* is a foreign key to *cName* in relation *company*.
• The attribute *wName* of relation *producesWine* is a foreign key to *wName* in relation *wine*. The attribute *cName* of relation *producesWine* is a foreign key to *cName* in relation *company*.
Part 1.1  Relational Algebra (Total: 100 Points)

Question 1.1.1  (7 Points)

Write a relational algebra expression that returns the names of all wheat beers.

Solution

$$\pi_{bName}(\sigma_{type='wheat'}(beer))$$

Question 1.1.2  (7 Points)

Write a relational algebra expression that returns companies (their name and number of employees) from the USA.

Solution

$$\pi_{cName,numEmpl}(\sigma_{country='USA'}(company))$$

Question 1.1.3  (7 Points)

Write a relational algebra expression that returns the names of wines that are red and sweet.

Solution

$$\pi_{wName}(\sigma_{type='red' \land dryness='sweet'}(wine))$$
Question 1.1.4  (7 Points)

Write a relational algebra expression that returns the names of all red and white wines.

Solution

\[ \pi_{wName}(\sigma_{\text{type}=\text{'red' } \lor \text{type}=\text{'white'}}(\text{wine})) \]

Question 1.1.5  (8 Points)

Write a relational algebra expression that returns the names of all beers produced by companies from Germany.

Solution

\[ \pi_{bName}(\sigma_{\text{country}=\text{'Germany'}}(\text{beer} \bowtie \text{producesBeer} \bowtie \text{company})) \]

Alternatively, people may use cross-product + renaming and selection or theta-join. The natural join with beer can be avoided.

Question 1.1.6  (12 Points)

Write a relational algebra expression that returns the countries of all companies that produce both wine and beer.

Solution

\[ \pi_{\text{country}}(\pi_{\text{Name, country}}(\text{company}\bowtie \text{producesBeer}) \cap \pi_{\text{Name, country}}(\text{company}\bowtie \text{producesWine})) \]

Alternatively, this can be done through joining company with both beer and wine through the produces relations
Question 1.1.7  (8 Points)
Write a relational algebra expression that returns the names of all wines and beers.

Solution

\((\pi_{wName}(wine)) \cup (\pi_{bName}(beer))\)

Question 1.1.8  (7 Points)
Write a relational algebra expression that returns the number of beers per type (e.g., wheat or ale)

Solution

\(\text{type}\cup\text{count}(\ast)(beer)\)

Question 1.1.9  (15 Points)
Write a relational algebra expression that returns the average alcohol content of all drinks sold by each company. For example, this expression should return tuples like (BeerInc., 5.25).

Solution
There are several ways how to express this query. For example, first computing average wine and beer alcohol content and number per company and then join the results and compute by adding the averages times numbers, divided by the total count.

**Question 1.1.10  (10 Points)**

Write a relational algebra expression that returns the number of companies that produce wine.

**Solution**

\[ G_{\text{count}}(\pi_{\text{Name}}(\text{producesWine})) \]

Many students will likely join with company which is not incorrect :-)

**Question 1.1.11  (12 Points)**

Write a relational algebra expression that returns the name of the company(ies) with the largest number of employees.

**Solution**

\[ \pi_{\text{Name}}(G_{\text{max}}(\text{numEmpl}) \ AS \ \text{numEmpl}(\text{company})\cup\text{company}) \]

Since we need max, the students may use the trick using set difference instead of aggregation here.
Question 1.1.12  (BONUS QUESTION) (10 Points)

Write a relational algebra expression that returns all companies that are producing less than 3 types of IPA beers.

Solution

\[
\begin{align*}
\text{numIPA} & \leftarrow \text{cName} \ \exists n \ (\sigma_{\text{type} = 'IPA'}(\text{beer}) \bowtie \text{producesBeer}) \\
\text{moreThan} & \leftarrow \pi_{\text{cName}}(\sigma_{n \geq 3}(\text{numIPA})) \\
q & \leftarrow \pi_{\text{cName}}(\text{company}) \setminus \text{moreThan}
\end{align*}
\]
